## METHODOLOGY

This poll was conducted July 26, 2016 using both automated (recorded) and live operator-initiated calls. In all, 1,128 registered voters completed all questions on the poll. About 30% (338) of the responses came from cell phones. The voters dialed were randomly selected from a proprietary registered-voter database to assure the greatest chance of providing an accurate cross-section of opinion from the statewide sample. Weighting formulas were applied to correct any over- and under-sampling. Each respondent was asked to verify that he/she was a Democrat who planned to vote in the next Democratic Primary Election.

Our sampling methodology ensures that *We Ask America* poll results are “projectable,” meaning that if every resident in a given geography were dialed, the results would not differ from the reported poll results by more than the stated margin of error at a 95% confidence level (the industry standard), if the same survey was repeated. For this case, results with a margin of error of  $\pm 3.0\%$  at the 95% confidence level means that if the same survey were conducted 100 times, 95 times out of 100 the results would not vary in either direction by more than 3.0% in either direction.
